Longest Helpmates with up to Six Men

One problem per material class:
the longest helpmate that still has a single solution

All 861 material classes from three to six men

Generated from the helpmate tablebase.
Every diagram, length and solution in this booklet is machine-derived.

The tablebase in brief

A *helpmate* is a chess problem in which both sides cooperate: Black moves first and helps White deliver mate. **h#n** asks for mate on White's nth move; in **h#n.5** White starts, so the solution opens $1\ldots$ and takes one half-move more. A problem is *sound* only if its solution is unique: a second solution is a cook.

The helpmate tablebase solves every legal position of every material class with up to six men. For each position and each side to move it stores the distance to mate under cooperation and the number of distinct shortest solutions, so a sound problem is simply a position whose count is one.

Classes in this booklet	861 (three to six men)
Positions in them	18.7 trillion (both sides to move)
With a helpmate	7.07 trillion
With a unique solution	438 billion
Longest unique problem	h#13: KBvkbbp, KBvkrp, KQBvkrp
Longest helpmate	h#17.5: KBvkqqp
Published compositions found	26

The tables are built by a C++ generator that works through each class depth by depth, from the mates outwards, after first building every table a capture or promotion leads to. They are checked by an independent solver on sampled positions, by an exhaustive cross-check of KQvk against python-chess, and by the requirement that a run on many threads writes byte for byte the same file as a run on one. Every table contributed from outside passes a seven-step verification before it is published.

How to read a page

Every class has one page. The header names the material, White's men first, and gives the problem's stipulation. Next comes the class at a glance: its longest unique problem, how many positions reach that length with a unique solution, its longest helpmate and its size, beside a chart of all its positions by distance to mate (bars), with the number of unique solutions at each distance on a logarithmic scale (line) and the problem's own length dotted.

Under the diagram stand the stipulation and the material count, white men plus black men. The solution is numbered in helpmate order, Black's move first. Where the position, or a close relative, has been published as a composition, the box under the solution names the author and sources. The *solve* link in the header and the QR code open the position in the Helpmate Analyzer (`helpman.komtera.lt`) with the stipulation already set.

Authorship and contributors

The helpmate tablebase and this booklet are the work of Oliver Sick, who maintains the project: the generator, the verification and the selection of the problems.

Most of the six-man tables were computed by T31M (584 tables) and popeye37 (77 tables) on their own machines and checked before publication. T31M also made the generator and the search for problems many times faster.

Maintainer	Oliver Sick (`osick`)
Contributors	T31M (584 tables) and popeye37 (77 tables)
Code	`https://github.com/osick/helpmate-tablebase`
Tables	`https://huggingface.co/datasets/osick/helpmate-tables`

Prior publication

The search for earlier publications is not complete. Each position was compared with a collection of published helpmates, and the matches found are named on the problem's page. A page without such a box does *not* mean that the position has never been published: no claim of originality or priority is made for any position in this booklet. Published problems remain the intellectual property of their composers. Earlier publications we have missed are welcome as an issue on GitHub.

Contents

The tablebase in brief ii

1. The corpus in numbers 1

2. Three men 5

3. Four men 9

4. Five men 47

5. Six men 229

A. Index of material classes 870

1. The corpus in numbers

This booklet covers 861 material classes holding 9 353 470 023 072 indexed positions. The longest unique problem in the whole corpus is **h#13** in KQBvkrp (page 231).

Coverage

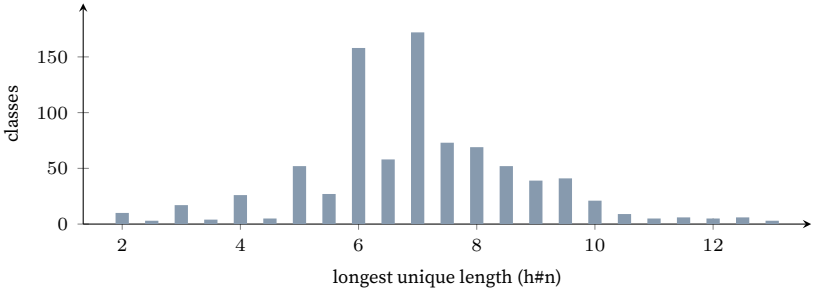

Every material class from three to six men in which a mate can exist is solved. Both orders count separately — White mates, so KRPvkb and KBvkrp are different problems — which gives 1 000 classes on paper. Of those, 125 have White with nothing but a bare king and cannot hold a mate, leaving the 875 counted here.

men	with a unique problem	can hold a mate	share
3	3	5	60.0%
4	37	40	92.5%
5	181	185	97.8%
6	640	645	99.2%
total	861	875	98.4%

A class can be solved completely and still have no page: either no mate exists in it at all, or no depth in it holds a position with a single solution. Such a class has no unique problem to show.

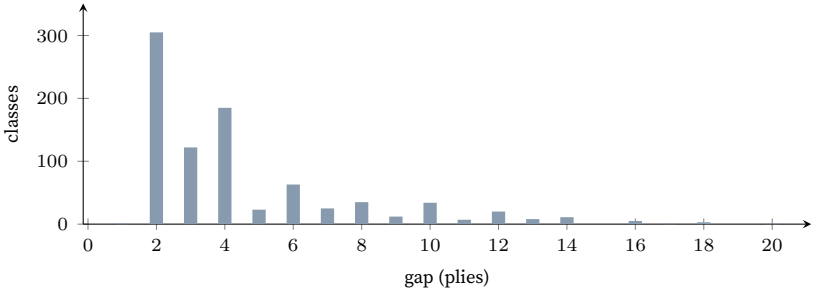

How long a unique problem gets

Distribution of the longest unique length across all 861 classes.

The gap to the class maximum

How much length uniqueness costs: the class's longest helpmate minus its longest unique one, in plies. It is never zero.

Mean 4.5 plies, median 4, worst 20 — KRBvkp, which runs to h#16 but whose longest unique problem is only h#6 (page 182).

The ten longest

material	unique	class max	gap	positions
KBvkbbp	h#13	h#16.5	7	2
KBvkrp	h#13	h#16.5	7	2
KQBvkrp	h#13	h#17	8	2
KBvkqbp	h#12.5	h#16.5	8	59
KBvkqqp	h#12.5	h#17.5	10	210
KBvkqrp	h#12.5	h#16.5	8	495
KBvkrpp	h#12.5	h#16.5	8	14
KBvkrrp	h#12.5	h#16.5	8	79
KPvkbpp	h#12.5	h#15.5	6	7
KBBPvkp	h#12	h#15	6	4

Rarity

At its longest unique length a class may hold a single position and nothing else. 81 classes are like that, and 335 hold ten or fewer. Those are the positions with no margin at all: change one man and the problem is gone.
